## **Sustaining Salmon**

Due largely to a strong science-based management approach, salmon in Alaska persist. But the species' long-term abundance and viability are under threat on several fronts — global warming, ocean acidification and incompatible development of salmon watersheds among them.

While marine scientists are deeply concerned about the future of salmon in many Alaskan watersheds, limited mechanisms or forums exist for sharing interdisciplinary knowledge about the fish. That is about to change.

A \$2.4 million grant from the Gordon and Betty Moore Foundation to UC Santa Barbara's National Center for Ecological Synthesis and Analysis (NCEAS) aims to address such issues. According to NCEAS Director Frank Davis, the project's overarching goal is to pull together all of the science pieces to gain a clearer picture of the salmon system in Alaska. "This is about the ecological system as well as the social system associated with salmon management in Alaska," he said.

NCEAS will work in partnership with Anchorage-based Nautilus Impact Investing, which provides advice to social and environmental investors. Together, the two organizations will work with a diverse coalition of Alaskan and national salmon experts to synthesize vast amounts of social, economic, ecological and related information.

"An important goal of the project is to create the capacity for ongoing synthesis among Alaskan salmon constituencies and stakeholders," said Davis. "To that end,

we will transfer some of NCEAS's approach to synthesis and collaboration to the Alaskan salmon science community."

The project will engage a series of expert working groups covering a wide range of topics. These groups will collate and analyze available data to answer key questions, such as the potential impacts of climate change on salmon in Alaska, and examine the global role and interconnectedness of Alaskan salmon stocks from biological, social and economic perspectives.

"It's ambitious, but our goal is to build a knowledge base that will have broad applications to address existing and emerging questions," said Nautilus principal Ian Dutton. "Our vision of success is that the synthesis we produce will be used by stakeholders to help sustain the already strong salmon system in Alaska. Through this collaboration, we will provide new insights and better access to information to people who depend on this resource over the long term."

## **About UC Santa Barbara**

The University of California, Santa Barbara is a leading research institution that also provides a comprehensive liberal arts learning experience. Our academic community of faculty, students, and staff is characterized by a culture of interdisciplinary collaboration that is responsive to the needs of our multicultural and global society. All of this takes place within a living and learning environment like no other, as we draw inspiration from the beauty and resources of our extraordinary location at the edge of the Pacific Ocean.
