An Ancient Disaster

In the Middle Bronze Age (about 3,600 years ago or roughly 1650 BCE), the city of Tall el-Hammam was ascendant. Located on high ground in the southern Jordan Valley, northeast of the Dead Sea, the settlement in its time had become the largest continuously occupied Bronze Age city in the southern Levant, having hosted early civilization for a few thousand years. At that time, it was 10 times larger than Jerusalem and 5 times larger than Jericho.

“It’s an incredibly culturally important area,” said [James Kennett](#), emeritus professor of earth science at UC Santa Barbara. “Much of where the early cultural complexity of humans developed is in this general area.”

A favorite site for archaeologists and biblical scholars, the mound hosts evidence of culture all the way from the Chalcolithic, or Copper Age, all compacted into layers as the highly strategic settlement was built, destroyed and rebuilt over millennia.

But there is a 1.5-meter interval in the Middle Bronze Age II stratum that caught the interest of some researchers for its “highly unusual” materials. In addition to the debris one would expect from destruction via warfare and earthquakes, they found pottery shards with outer surfaces melted into glass, “bubbled” mudbrick and partially melted building material, all indications of an anomalously high-temperature event, much hotter than anything the technology of the time could produce.

“We saw evidence for temperatures greater than 2,000 degrees Celsius,” said Kennett, whose research group at the time happened to have been building the case for an [older cosmic airburst about 12,800 years ago](#) that triggered major widespread burning, climatic changes and animal extinctions. The charred and melted materials at Tall el-Hammam looked familiar, and a group of researchers including impact scientist Allen West and Kennett joined Trinity Southwest University biblical scholar Philip J. Silvia’s research effort to determine what happened at this city 3,650 years ago.

Their [results](#) are published in the journal Nature Scientific Reports.

Salt and Bone

“There’s evidence of a large cosmic airburst, close to this city called Tall el-Hammam,” Kennett said of an explosion similar to the Tunguska Event, a roughly 12-megaton airburst that occurred in 1908, when a 56-60-meter meteor pierced the Earth’s atmosphere over the Eastern Siberian Taiga.

The shock of the explosion over Tall el-Hammam was enough to level the city, flattening the palace and surrounding walls and mudbrick structures, according to the paper. The distribution of bones indicated “extreme disarticulation and skeletal fragmentation in nearby humans.”

For Kennett, further proof of the airburst was found by conducting many different kinds of analyses on soil and sediments from the critical layer. Tiny iron- and silica-rich spherules turned up in their analysis, as did melted metals.

“I think one of the main discoveries is shocked quartz. These are sand grains containing cracks that form only under very high pressure,” Kennett said of one of many lines of evidence that point to a large airburst near Tall el-Hammam. “We have shocked quartz from this layer, and that means there were incredible pressures involved to shock the quartz crystals — quartz is one of the hardest minerals; it’s very hard to shock.”

The airburst, according to the paper, may also explain the “anomalously high concentrations of salt” found in the destruction layer — an average of 4% in the sediment and as high as 25% in some samples.

“The salt was thrown up due to the high impact pressures,” Kennett said of the meteor that likely fragmented upon contact with the Earth’s atmosphere. “And it may be that the impact partially hit the Dead Sea, which is rich in salt.” The local shores of the Dead Sea are also salt-rich, so the impact may have redistributed those salt crystals far and wide — not just at Tall el-Hammam, but also nearby Tell es-Sultan (proposed as the biblical Jericho, which also underwent violent destruction at the same time) and Tall-Nimrin (also then destroyed).

The high-salinity soil could have been responsible for the so-called “Late Bronze Age Gap,” the researchers say, in which cities along the lower Jordan Valley were abandoned, dropping the population from tens of thousands to maybe a few hundred nomads. Nothing could grow in these formerly fertile grounds, forcing people to leave the area for centuries. Evidence for resettlement of Tall el-Hammam and nearby communities appears again in the Iron Age, roughly 600 years after the cities’ sudden devastation in the Bronze Age.

Fire and Brimstone

Tall el-Hammam has been the focus of an ongoing debate as to whether it could be the biblical city of Sodom, one of the two cities in the Old Testament Book of Genesis that were destroyed by God for how wicked they and their inhabitants had become. One denizen, Lot, is saved by two angels who instruct him not to look behind as they flee. Lot’s wife, however, lingers and is turned into a pillar of salt. Meanwhile, fire and brimstone fell from the sky; multiple cities were destroyed; thick smoke rose from the fires; city inhabitants were killed and area crops were destroyed in what sounds like an eyewitness account of a cosmic impact event. It’s a satisfying connection to make.

“All the observations stated in Genesis are consistent with a cosmic airburst,” Kennett said, “but there’s no scientific proof that this destroyed city is indeed the Sodom of the Old Testament.” However, the researchers said, the disaster could have generated an oral tradition that may have served as the inspiration for the written account in the book of Genesis, as well as the biblical account of the burning of Jericho in the Old Testament Book of Joshua.

About UC Santa Barbara

The University of California, Santa Barbara is a leading research institution that also provides a comprehensive liberal arts learning experience. Our academic community of faculty, students, and staff is characterized by a culture of interdisciplinary collaboration that is responsive to the needs of our multicultural and global society. All of this takes place within a living and learning environment like no other, as we draw inspiration from the beauty and resources of our extraordinary location at the edge of the Pacific Ocean.
