Physics professor [Philip Lubin](#) is one of six research fellows selected by NASA to receive a \$600,000 two-year grant as part of Phase II funding in the NASA Innovative Advanced Concepts (NIAC) program. He and the others selected have been awarded the funds to develop their space-oriented concepts — futuristic projects designed to share air and space travel, decades in the future.

Lubin was selected for his [PI \(Pulverize It\) project](#), a planetary defense concept that according to NASA “could provide Earth with a rapid-response capability to mitigate a disastrous impact from an asteroid or comet by pulverizing the object into pieces small enough to burn in the Earth’s atmosphere.” By deploying penetrator rods to intercept the incoming space rock, the aim is to break it up before it hits the Earth and avoid cataclysmic damage.

“NASA’s story is one of barriers broken and technologies transformed to support our missions and benefit all of humanity,” said NASA Administrator Bill Nelson. “The

concepts selected under NASA's Innovative Advanced Concepts program will help empower researchers to usher in new technologies that could revolutionize exploration in the heavens and improve daily life here on Earth."

Other projects selected for the award include a dynamically tunable quantum radar technology to improve remote sensing studies of Earth and other worlds; nearly silent electroaerodynamic thrusters for vertical takeoff and landing aircraft for transportation; using nuclear decay of radioactive material in a radioisotope electric propulsion system to propel spacecraft at extremely high speeds; a massive radio telescope array on the Moon's surface; and the use of bacteria to create medical drugs on demand during extended spaceflight missions.

## About UC Santa Barbara

The University of California, Santa Barbara is a leading research institution that also provides a comprehensive liberal arts learning experience. Our academic community of faculty, students, and staff is characterized by a culture of interdisciplinary collaboration that is responsive to the needs of our multicultural and global society. All of this takes place within a living and learning environment like no other, as we draw inspiration from the beauty and resources of our extraordinary location at the edge of the Pacific Ocean.
